Seminars and Field Trips

Engineering the Future: Essential Skills for Computer Engineers in the Age of AI

Feb 14, 2026

Speaker:

Engr. Sean Ray Relacion

Organizer:

Lance Oliver Bacus

Eric Mar Geonzon

Certificate of Participation

The seminar "Engineering the Future: Essential Skills for Computer Engineers in the Age of AI" was presented by Sir Sean Ray Relacion. During the seminar, he talked about how Artificial Intelligence (AI) is changing the world and creating new opportunities for computer engineers. He explained that AI is now being used in many areas such as education, healthcare, business, transportation, and technology. Because of this, computer engineers need to develop the right skills to succeed in the future.

One of the main points discussed by Sir Sean was the importance of having strong technical skills. He explained that computer engineers should learn programming, software development, computer systems, and other technologies related to AI. These skills help engineers create and improve systems that can solve real-world problems. He also mentioned that technology changes very quickly, so students should always be willing to learn new things and keep improving their knowledge.

Sir Sean also talked about the importance of problem-solving and critical thinking. Even though AI can perform many tasks automatically, people are still needed to design, manage, and improve these systems. Computer engineers must be able to analyze problems and find effective solutions. He encouraged students to think creatively and use their knowledge to develop useful technologies that can help society.

Another important topic in the seminar was soft skills. Sir Sean explained that technical knowledge alone is not enough to become successful. Computer engineers should also have good communication, teamwork, and leadership skills. In many workplaces, engineers work with different people and departments. Because of this, it is important to communicate ideas clearly and work well with others. He emphasized that employers value people who can cooperate with a team and adapt to changes.

The seminar also discussed the responsible use of AI. Sir Sean reminded students that technology should be used in a way that benefits people and society. Engineers should consider privacy, security, and fairness when developing AI systems. He explained that computer engineers have a responsibility to make sure that technology is used properly and ethically.

Overall, the seminar was very informative and inspiring. Sir Sean Ray Relacion shared valuable lessons about the skills needed by future computer engineers in the age of AI. I learned that being a successful computer engineer requires more than just technical knowledge. It also requires continuous learning, problem-solving skills, communication, teamwork, and responsibility. The seminar helped me understand the importance of preparing for future technological changes and motivated me to improve

my skills so that I can become a competent and responsible computer engineer in the future.
